

Universal-BiCGR improves BRCA HRD prediction, with strongest gains at fixed HRD thresholds and HRD score endpoints

Panel A: nested-CV Spearman ρ (Δ Spearman ρ = Universal – Standard); dependent correlations compared with Steiger tests. Panel B: nested-CV AUROC at HRD ≥ 24 / ≥ 33 / ≥ 42 (axis = AUROC; segment length = Δ AUROC); compared with DeLong tests. Panel C: burden-stratum refits (exploratory robustness; p-values not shown). Significance stars on A and B: * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.
